

Design changes:

1. HTTPRequest/HTTPResponse implementations: adding parse/write functions for all classes -> refactoring and improving code reusability and clarity.
2. StationData implementations: adding local timestamp using `System.currentTimeMillis()` to track the expired date and delete aggregation server data if it reaches the maximum size of 20.
3. Using the “synchronized” method to lock Lamport Clock access in the Aggregation server when taking requests and writing responses for race condition prevention.
4. Change from holding responses while keeping the read/write lock to sending responses outside of the lock to prevent delay.
5. Adding more response status codes: 404, 409, for more client error handling.
6. Fail to implement the Concurrency test for only the Lamport Clock.
